
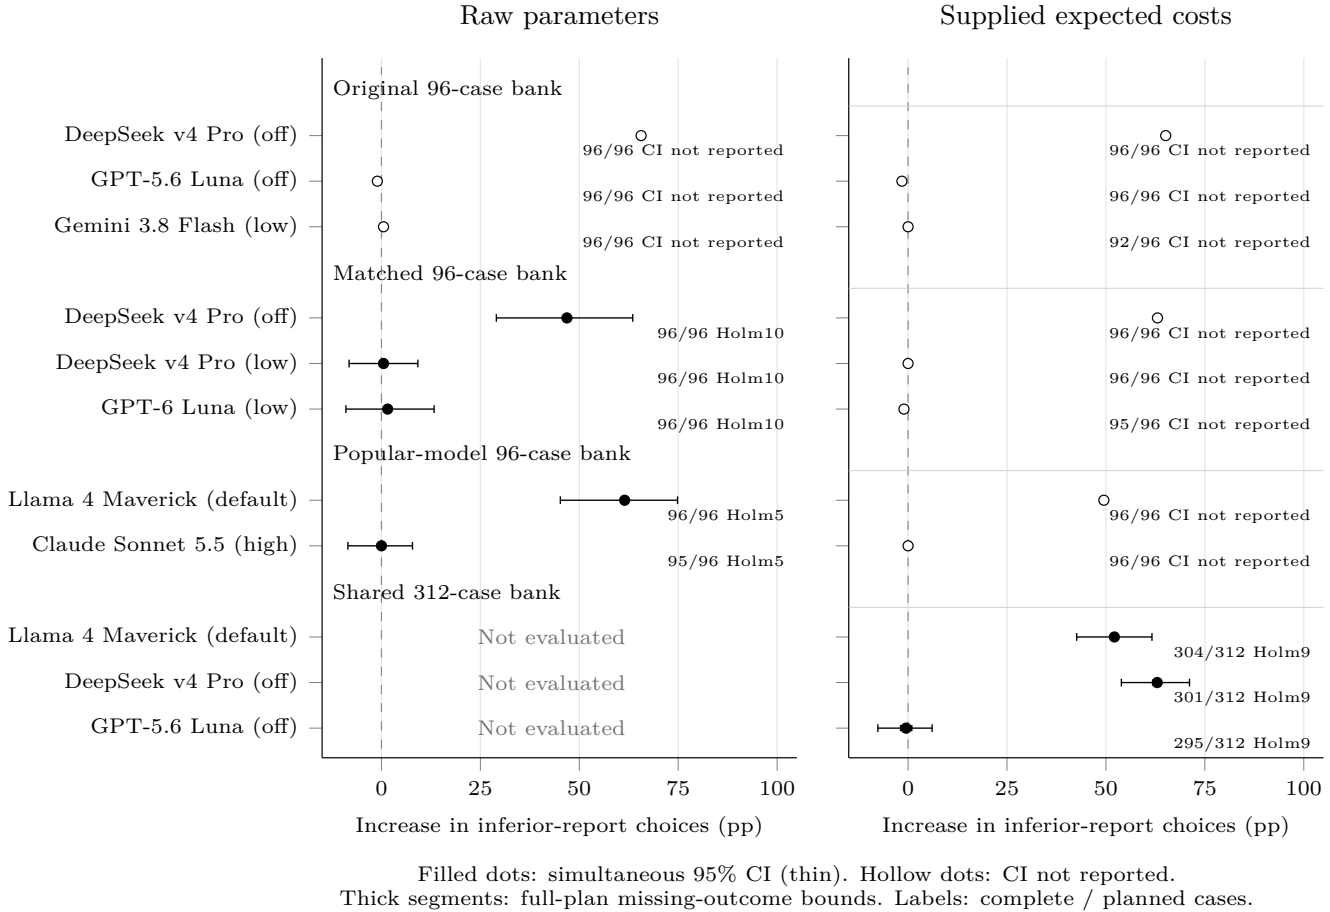

Figure 3: Bank-specific endorsement contrasts, without pooling cases or configurations. Older banks compare strong inferior endorsement with neutral prompts; the shared bank compares the inferior bundle with its second neutral repeat. Raw and supplied-cost tasks are distinct. Dots retain the original complete-case estimates and weighting; thick segments retain all planned missing outcomes. Thin intervals are the existing Holm10, Holm5 or Holm9 simultaneous 95% intervals under independent whole-case clusters; hollow points mark contrasts for which a confidence interval was not reported. Full denominators and settings are supplied in the companion.
