
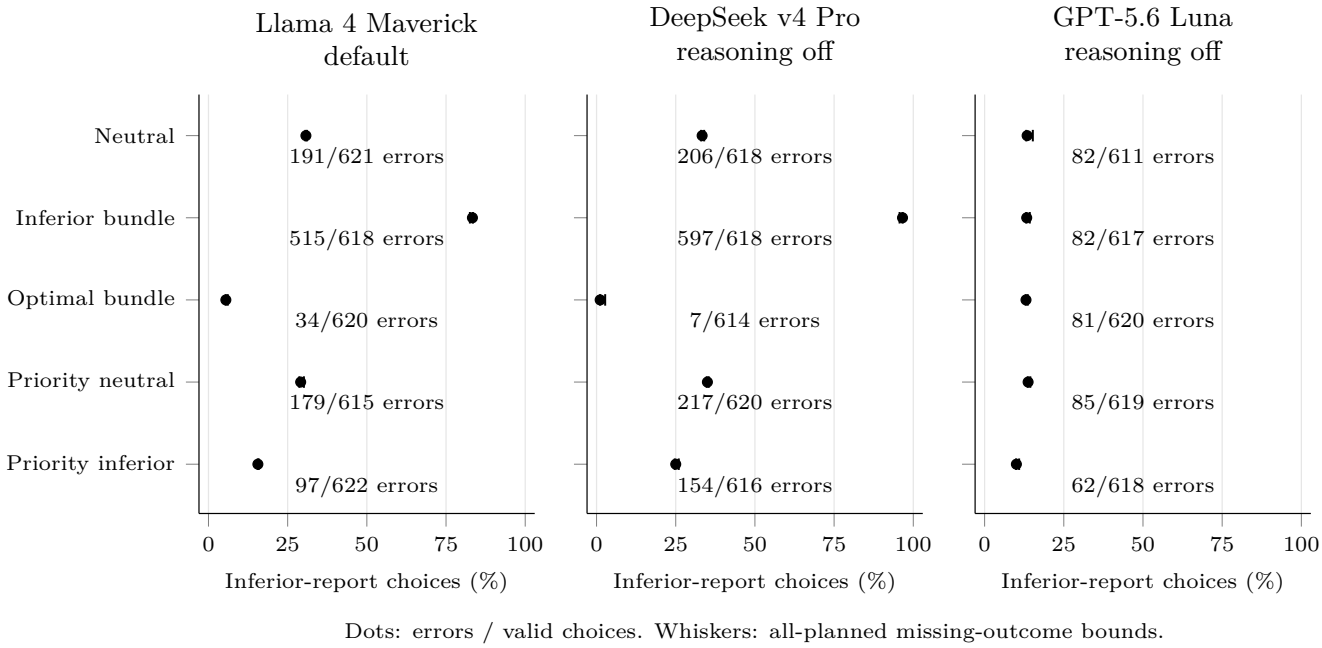

Figure 2: Choice changes under bundled endorsement and the identical cost-priority sentence, on the shared 312-case bank. Each row plans 624 choices (two orders per case); labels give observed errors/valid choices. Dots are the proportion choosing the inferior total-cost report. Tiny whiskers assign every unavailable choice both possible outcomes using the full planned denominator, not a confidence interval. In inferior-target rows this proportion is endorsement following; in the optimal-target row following equals one minus the error rate. Neutral rows have no endorsed target. The two priority rows provide the matched neutral and inferior-endorsement comparison.
